## Treatment Options

There are a variety of treatment options available for prostate cancer, depending on the stage of the cancer and the patient's overall health. Some of the most common treatment options include:

- **Surgery:** Surgery is the most common treatment for localized prostate cancer. The goal of surgery is to remove the prostate gland and any

surrounding lymph nodes that may contain cancer cells.

- **Radiation therapy:** Radiation therapy uses high-energy beams to kill cancer cells. Radiation therapy can be given externally, using a machine that delivers radiation to the prostate gland from outside the body, or internally, using radioactive seeds that are implanted into the prostate gland.
- **Hormone therapy:** Hormone therapy is a type of treatment that uses hormones to block the growth of cancer cells. Hormone therapy can be used to treat prostate cancer that has spread to other parts of the body.
- **Targeted therapy:** Targeted therapy is a type of treatment that uses drugs to specifically target and kill cancer cells. Targeted therapy can be used to treat prostate cancer that has become resistant to other treatments.

## Choosing the Right Treatment

The best treatment for prostate cancer depends on a number of factors, including the stage of the cancer, the patient's overall health, and the patient's personal preferences. It's important to discuss all of the treatment options with your doctor before making a decision.

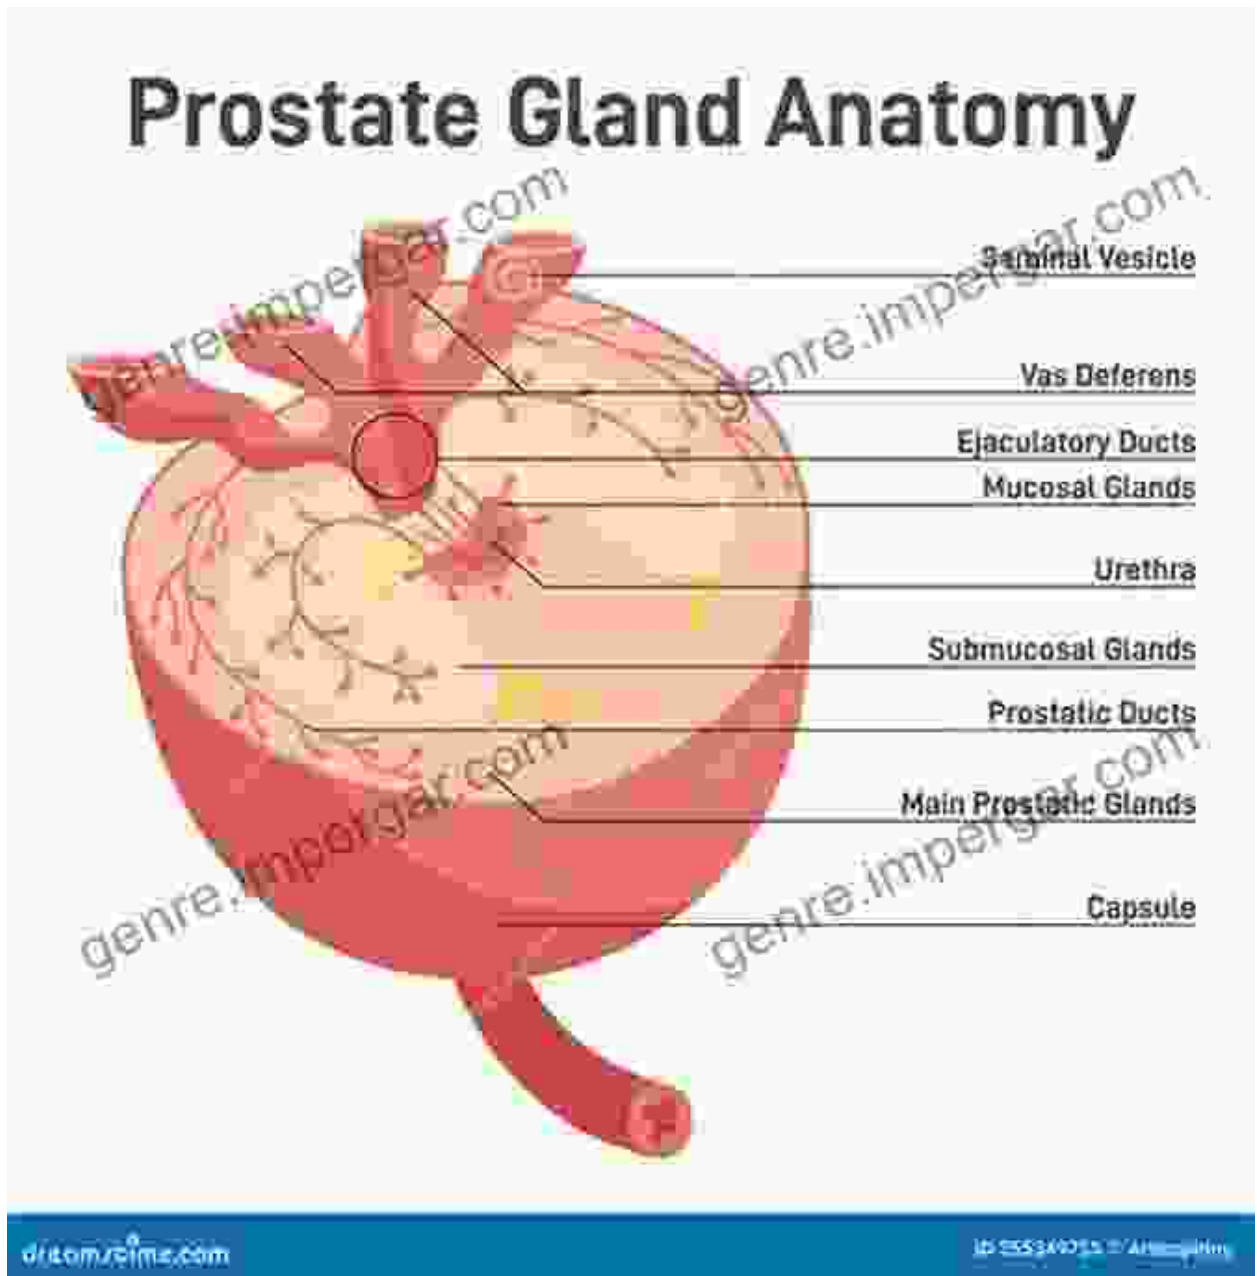

If you are diagnosed with prostate cancer, don't panic. There are a variety of effective treatment options available, and the vast majority of men with prostate cancer are able to live long, full lives.
